

ABSTRACT

1 An improved structure of formative lighting fixtures comprises a frame, a
2 plurality of bulbs, and a refracting layer, in which the frame is formed by gathering a
3 plurality of rods and profiled in a specific contour, the bulbs are installed on the frame
4 to serve for lighting ornaments, and the rods on the frame are coated with a refracting
5 layer of a transparent material. A formative lighting fixture so constructed can offer a
6 dazzling effect to thereby reduce bulb amount and facilitate production.
